Full month, year

Proposal Template, v2

by

Fujimiya Amane

Abstract: This is a template for all RHINELAB-RINALAB proposal writing, on either research, project, working, event hosting, etc. Please use this template and specify information regarding what is required.

This is **version 1** of the template. Subjected to change.

This is **version 2** of the template, with minor corrections and addition of *military-specific research*.

Keywords: Keyword1, Keyword2, Keyword3

1 Specification

Provide specification details, metaprogramming.

1.1 Document code, priority

Provide document codes, additional document code, purpose, organization, authorship and anyone contributing to the report, identification of purpose (proposal, or research, indexing 01). Priority code, additional conditions. Does it override anything, or add to anything?

1.2 Body of issue

Who issue, team or departmental attachment.

1.3 Date and Version

Version specification across versions, and similarly date of construction. **Do not remove old dates**, for versioning record.

2 Introduction

The introduction section must include the following:

2.1 Proponent

Who proposed the project? Which team? What is the member scope? Is this collaborators-allowed or member-only? Situation description of the person?

2.2 Subject classification

Where and what type of subject is the proposal in? Are there any problem regarding such, and are there any form of cross-subject problem or warning beforehand.

2.3 Motivation

What is the road that led to this project. Write it in simple form, you do not to have it fleshed out - it is a proposal after all. However, specify briefly,

1. Personal observation.
2. Preliminary observation after personal one about the related context.
3. Resolution ad temporary.

That is the minimum information required, and you can add more if needed.

2.4 Checkerboard

The following must be then finalized, under **safety assessment** and pillar check:

- What is the reaching here? Is it overreaching to undefined terms?

- What is the purpose here? Does it concern eventual publication or exposure to any third-party that would not align to the general purpose of RHINELAB, i.e. for example, open-source directive?
- If it is military, check the mandate on allowed research. Is it dual-use? What is its purpose, what are the details about this dual-use research? What is the consequence for such dual-use research?
- Is it benefiting and with sufficient contribution role to the entire lab in general, and the **foundational knowledge system and archive**? How much?
- If the proposal leans on **administrative side**, i.e. you are *proposing to open a new department or research group*, specify **in full** why, is this necessary. Have you checked it to be minimal? Do you think it is necessary? Do you realize that this is a very important move and prospect and would be very important to be kept on track of? Specify in full, and answer if the proposal on this structure overreach, erase other parts of the laboratory functions without justification, and again simply overreach its academic authority as well as administrative authority?

2.5 Requirement

Answer most of the questions if able.

1. What is the required knowledge, stage of knowledge within respective subject classification, specialized knowledge, expected knowledge?
2. If the knowledge is specified to be also **under development while doing the proposal itself**, what is the knowledge in question, how are you planning to fill it in, fill it where, what format, artifact (when doing or learning anything, you have to provide back certain amount of **proof-of-work** in the form of report, crystallization, notes, etc.)? Duration and percentage of this in the project?
3. What is the platform that the proposal is planning to use? For example, if the code is on GitHub, or if the project code is on GitLab, or the proposal is for internal, and we use SyncTrazor and peer-to-peer sharing for coordination?
4. What would be used to communicate between the people researching this project, the project team leader, the project supervisors, and every other components? How do you log the conversations there so that to satisfy the transparency requirement?
5. What is the end-goal requirement? Paper, or project finalization, modules and code reusable by the laboratory? Briefly on this point.
6. Time commitment - what is the time commitment of members on this? Does it require anything?
7. Roles - what kind of roles are required and established in the proposal working group? For example, a mixed 5-people group still have to have domain-expert, coding handler, architectural and theoretical analysis guy, and so on. Do you have them, or else? What is the percentage of each you want? If the work is more theoretical, then the percentage of hardware people is zero or marginal, for example.

There will be more questions, and should you provide more information, it is **preferred** of doing so, because it will help others in determining their fit and contribution thereof, especially when people can try getting their participation in mid-project or mid-research.

Analytical view

For better understanding of the proposal, provide rigorous reading and analysis on:

1. Literature and **field review**: What is the field (briefly) and intersection thereof if exists, current state of the field, current state of the problem, definition of the problem, literature analysis of the problem.
2. Research problem analysis (original of yourself) aside from literature review. **Justification** of those analyses and identification that gave rise to this project.
3. Goal - research or work goal in achieving the proposal finalization, in specificity.
4. **Research/Work methodology** and design - how the work is designed in operation? What is the methodology used to reach the goal? Analysis of the road to there, is it difficult in terms like time, knowledge uncertainty, conflicted interest and uncertain benchmark? What is required to develop and what can be done within existing system? Optional - is the work interpretation and modification, or development of existing framework or something original in its form?
5. Implication and **contribution to knowledge** - what does it imply about the purpose of the project? Speak plainly, do not hedge it like you are doing it for shareholder. What is the contribution - either **lab-based contribution** to the infrastructure and base of the lab, research of the lab and so on, or - **field-wide**, in general contribution to the state of the field in specific classification and in general?

Of this, please provide, if there are *any*, **preliminary analysis and work**. Better yet even draft of current finding. Link them to the proposal if able. Use the link in simple form as link like this.

Timeline and resource

Finalization requires timeline. Specify it briefly. Provide **uncertainty in timeline**. Remember this. When you have fixed time, it must be earned, because you are setting up the **end date**.

This mean at approximately accurately that time, the timeline must be there and you must reach there. The capacity will determine if you can be there or not.

In all, you must state explicitly **how wrong you might be** and in which direction during the work. If it is routine work or project, then good. If not, do this.

All of the above analysis are there to provide people the sense of counter-uncertainty in description of project. If you fail from those, this part of the timeline will read like someone dreaming too high without scaffolding.

For the resource part, do you require afterward financial non-trivial (i.e. it costs something)

support and funding? This is to organize the project in the funding handler, so that we can do a fundraiser or funding proposal explicitly.

Instruction will be given if the proposal requests funding. Any other kind of hardware resources, software, architecture and infrastructure support - for example, the team want the core management team to research on certain platform and so on, or creating sheets or tables to coordinate, or specific lab presence on certain platform, GitHub, Mastodon etc. since the proposing team operates there.

Should all of that be in question, include it here **explicitly**. If you do not have any, **empty this part**.

Acknowledgements (optional)

Thanks again to **Person 1** and **Affiliation A** for their financial support. Thanks **Person 2**, **Person 3**, etc. for their participation in drafting this document. Further information.

A An appendix

Appendix to more information. Analysis, cost process, etc.

B Another appendix

Subsectioning in appendix

Some more text, and a list:

1. First item in a list
2. Second item in a list
3. Third item in a list
4. Fourth item in a list
5. Fifth item in a list

C Citations

Items that are cited: *The L^AT_EX Companion* book [GMS93] together with Einstein's journal paper [Ein05] and Dirac's book [Dir81]—which are physics-related items. Next, citing two of Knuth's books: *Fundamental Algorithms* [Knu73] and *The Art of Computer Programming* [Knu].

Remember to change this to your respective bibliography. Usually, the file that holds the bibliography in the path is `bibb.bib`, so beware of that. The below part where there is `printbibliography` does it work - it prints the bibliography. Cite them using the `cite` key seen in the above citation.
